Technical Exercise

Instructions:

To help us understand your technical abilities better, we'd like you to create a simple mobile application that fulfills a few requirements. Feel free to take liberties with some of the UI design and architecture, and looks for ways to show off your strengths.

Create a new React Native project for Android or iOS (you only need to choose one) that does the following:

1. Shows a list of companies
2. Tapping on a company shows each company's name, address and last 6 months of revenue on a chart

Use the MPAndroidChart/Charts library to create a native module to display the data in the JSON file inside the repo. Create your own module; **do not** use one from another source (e.g. NPM).

You can clone the provided repo. We'll be looking at your general use of git as you implement your solution. Include any special setup instructions we will need to run your project. You will also present your project during your interview.

Good luck, and have fun!
